Abstract:

Geospatial technologies generally provide a top down approach but development requires a bottom up approach in which the needs of the individual is considered. Today technology can provide services which can be customised to the individual needs. The Indian rural environment is burgeoning and is a potential market for innovative geospatial solutions. By creating a collaboration between geospatial resources and utilizing modern technologies of communications, digital data, sensor networks and delivery systems like cloud computing and GRID we can configure custom applications for individual customers in rural areas.
